# Connecting your style sheet

From the select language menu pick CSS and save your new CSS file to an appropriate folder, eg the one with your HTML doc in it.

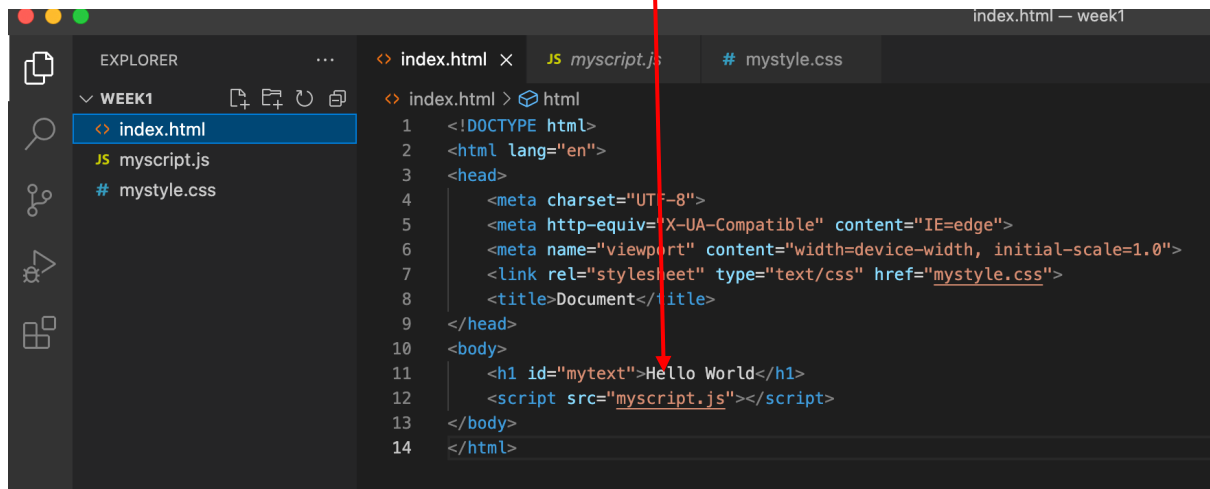

Notice on the left you can open explorer view and open your current work folder

You need to copy the text from line 7 to connect your CSS to your HTML. Remember about folder structure from last term, so if you have your CSS file in a folder called CSS your link would be CSS/mystyle.css for example.
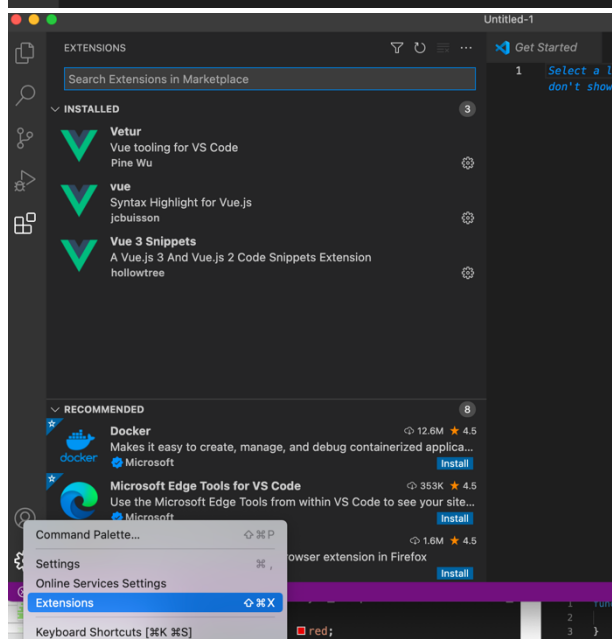

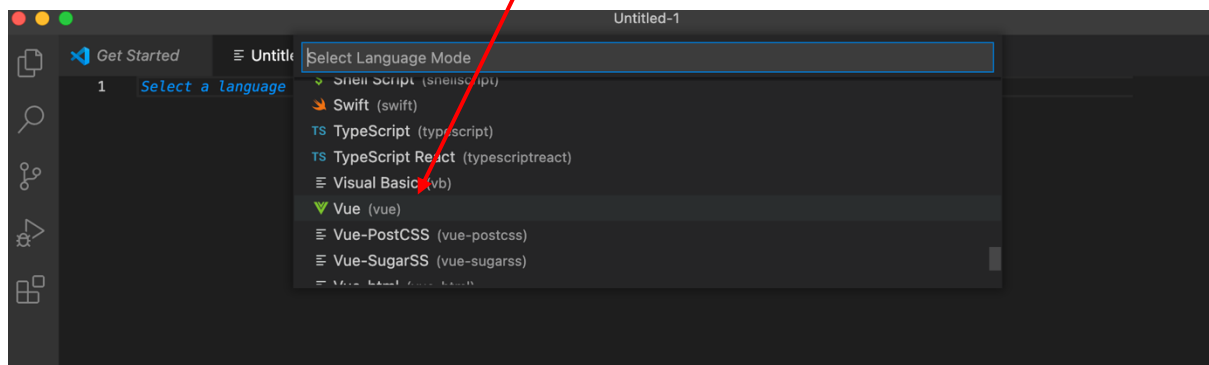

Very similar to creating an external JS file, select JavaScript from the language menu save your file as myscript.js and connect it to your HTML as in line 12.

Other features of VS Code

Notice I have Vue in my list of languages

There are many language extensions you can add to VS code and Sublime text.
Click the settings cog bottom left and pick extensions from the menu.
You can see the 3 Vue extensions I have installed. Vetur, vue and Vue 3 Snippets.

.

You can search for others in the search box, for example there are many PHP extensions. You can experiment with these extensions in your own time, I have not used many of them. There may be restrictions on the lab machines, I'm not sure.
